

Classes of Character classes

Reader

- (i) FileReader
- (ii) CharArrayReader
- (iii) BufferedReader
- (iv) InputStreamReader
- (v) PipedReader
- (vi) Scanner
- (vii) Console

Writer

- (i) FileWriter
- (ii) CharArrayWriter
- (iii) BufferedWriter
- (iv) OutputStreamWriter
- (v) PrintWriter
- (vi) PrintWriter

File
Files } came in 'nio' packages
Path
Paths

- And as soon as buffer gets filled all ~~data~~ data is transferred into file.
- In absence of this buffer, each ~~write~~ 'write' command has to write into file one-by-one, degrading the performance.

- And we move data from 'fin' buffers to program.
- And as soon as 'fin' gets empty next data comes into 'fin' from file.
- In absence of buffer, we have to get file to fetch data one-by-one degrading performance.

Byte Stream classes

(1) File Output Stream - FileOutputStream

FileOutputStream fout = new FileOutputStream("abc.txt");
↳ FileName

↳ This file gets created in parallel to 'class' file & gets connected to the object (buffer's 'fout').

FileInputStream fin = new FileInputStream("abc.txt");

Here as soon as buffer is created, a data of size of buffer is transferred from file to buffer.
